NETIX

Internet Peering

Dean Belev (VP Services)

What is Internet Peering ?

"...peering is a voluntary interconnection of administratively separate Internet networks for the purpose of exchanging traffic between the "down-stream" users of each network." **Source:** WIkipedia

Peering Options/Sources

- Transit customers (customers)
- Peering partners (peers)
- Internet Exchange Points (IXPs)

How to measure the Peering

- Peering traffic vs Transit ratio
- Cost savings from Transit
- as-path-length ("...the average number of steps along the shortest paths for all possible pairs of network nodes." **Source:** WIkipedia)
- Peers (Quantity & Quality)

BENEFITS OF PEERING

Cost savings:

Peering allows networks to exchange traffic without having to pay for it, which can be a cost-effective alternative to using IP Transit services.

Improved network performance:

Peering can result in lower latency and improved network performance, as traffic between the two networks can be exchanged directly, rather than having to pass through multiple intermediaries.

Increased network resilience:

Peering can improve network resilience by providing multiple paths for traffic to travel between the two networks. If one path fails, traffic can automatically be routed via another path.

Improved customer experience:

Peering can improve the customer experience by reducing network congestion and improving network performance, resulting in faster and more reliable access to online services and applications.

Increased network control:

Peering allows networks to have more control over how their traffic is routed and delivered, which can be beneficial for networks with specific requirements or preferences for how their traffic is handled.
