

**RIPE NCC**  
RIPE NETWORK COORDINATION CENTRE

# RIPE RIS

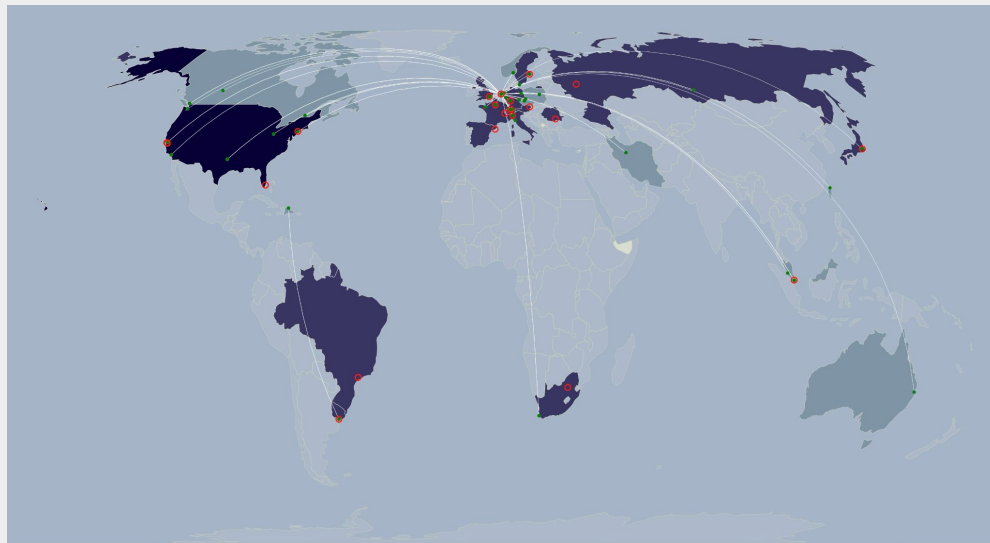

---

Routing Information System for Shared  
Routing Intelligence

## What is RIS?

- RIS is a route data collection platform
- Collecting BGP data since 1999
- Collaborative with community

## What is RIS?

- RIS is a route data collection platform
- Collecting BGP data since 1999
  - We *permanently* store the data (BGP tables + BGP updates)
  - Long-term archive is *publicly and freely available*
- Collaborative with community
- Used by many tools and researchers
  - RIPE NCC: RIPEstat, riswhois (IP to origin AS + prefix), ris-live, ...
  - Others: Academic research, open source tools, commercial tools, ...

# What is RIPE RIS?

## System overview

- A world-wide network of route collectors
- *Many* BGP peers that have BGP sessions with those collectors
- Standard components
  - Linux servers
  - ExaBGP
  - Kafka message broker
- + Custom data processing and plumbing

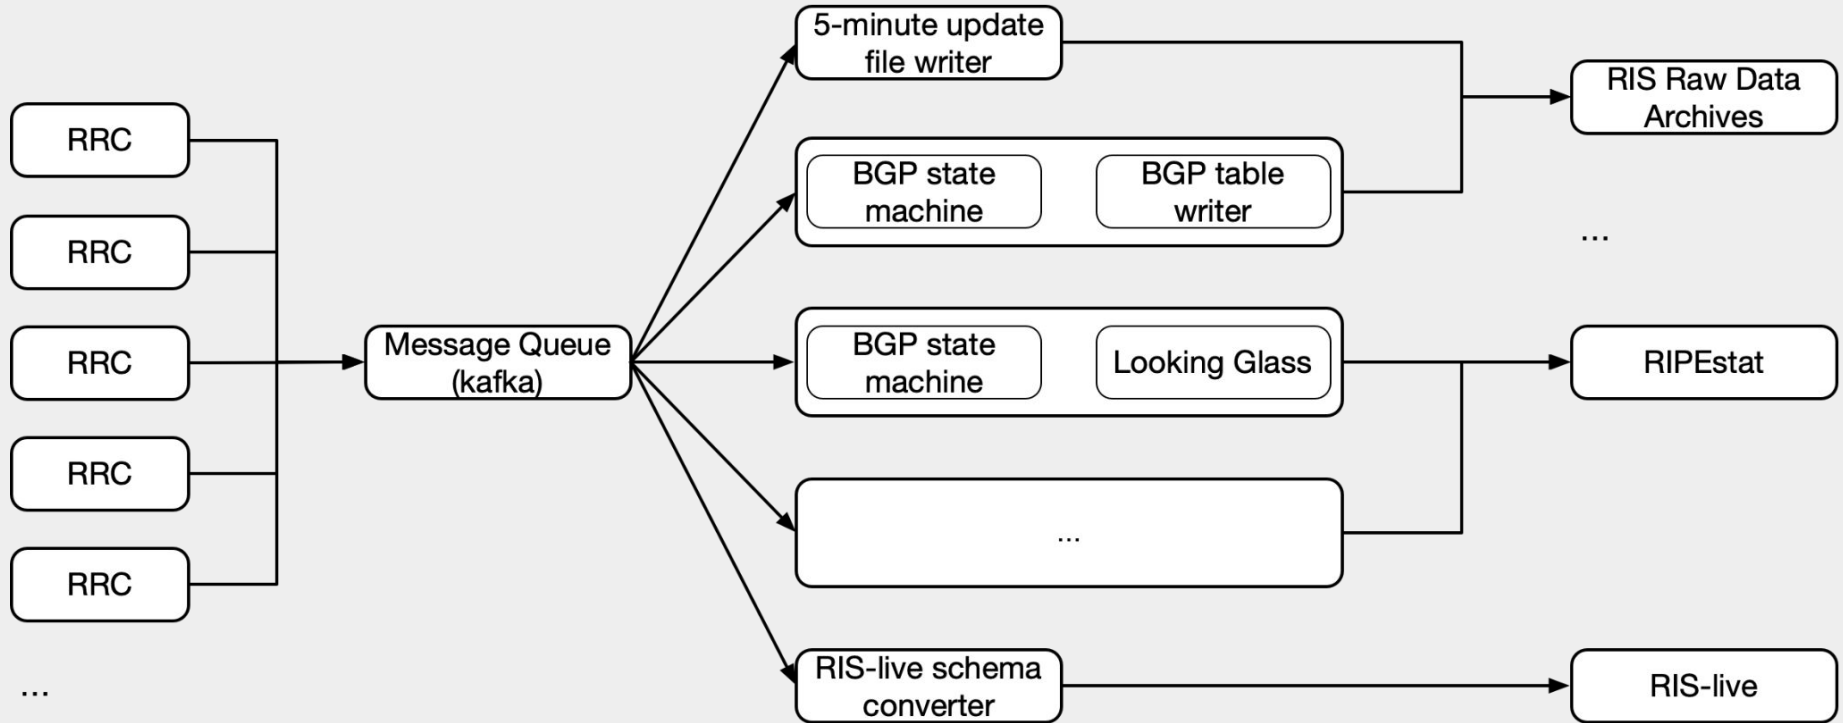

# What is RIPE RIS?

## System overview

- A world-wide network of route collectors
- *Many* BGP peers that have BGP sessions with those collectors
- Standard components
  - Linux servers
  - ExaBGP
  - Kafka message broker
- + Custom data processing and plumbing
  
- *Many* BGP peers: A lot of routes and updates.
- 21 May 2026:
  - ~366M IPv4 routes, ~84M IPv6 routes
  - 17.5K bgp announcements/withdraws per second on average,
  - 46k A/W per second peak one-minute average (across five days)

# RIS Architecture

# RIS Over Time: Number of Active BGP Sessions

## Remember: We store all data permanently

- Data size continuously increases
- Selecting relevant data is hard
  - For researchers: data volume is too big
  - For us as well: peering is selecting data for long-term observation

## Remember: We store all data permanently

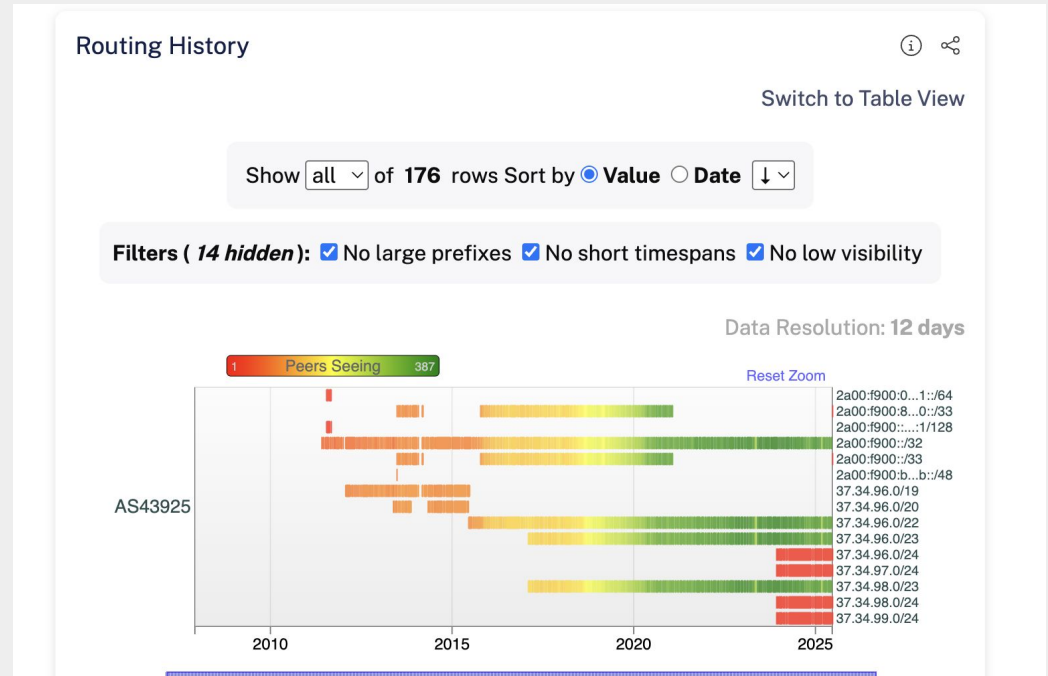

- Data size continuously increases
- Selecting relevant data is hard
  - For researchers: data volume is too big
  - For us as well: peering is selecting data for long-term observation
- We now have a selective [peering policy](#)
  - We will update it soon
  - Part data driven
  - Important part: validation
- We *really* want to learn about the most relevant interconnection in a region. Please talk to us!

# How is RIS Data Used?

## By us:

- In our tools
- In our internet analysis

# How is RIS Data Used?

# How is RIS Data Used?

## By us: routing analysis

- In our tools
- In our internet analysis

This example:

- Cable damage caused a spike in BGP updates for affected prefix
- Hard to find the needle in the haystack!

# How is RIS Data Used?

## By others:

- Often used in research
  - Example: [CAIDA ASRank](#)
- In open source software
- In other products

**ASRank** is CAIDA's ranking of [Autonomous Systems \(AS\)](#) (which approximately map to Internet Service Providers) and organizations (Orgs) (which are a collection of one or more ASes). This ranking is derived from topological data collected by CAIDA's [Archipelago Measurement Infrastructure](#) and [Border Gateway Protocol \(BGP\)](#) routing data collected by the [Route Views Project](#) and [RIPE NCC](#).

ASes and Orgs are ranked by their [customer cone size](#), which is the number of their direct and indirect customers. Note: We do *not* have data to rank ASes (ISPs) by traffic, revenue, users, or any other non-topological metric.

1 2 3 4 .. 1987 ASes are sorted by their relationship, which is inferred from observed BGP paths. Note: we do not have data to infer financial arrangements between ASes.

AS Rank ▲	AS Number ▼	Organization		cone size (ASes) ▼
1	3356	Level 3 Parent, LLC		54887
2	1299	Arelion Sweden AB		42167
3	3257	GTT Communications Inc.		41285
4	174	Cogent Communications, LLC		41127
5	2914	NTT America, Inc.		25338
6	6939	Hurricane Electric LLC		22380
7	6453	TATA COMMUNICATIONS (AMERI...		21929
8	6461	Zayo Bandwidth		20242
9	6762	Telecom Italia S.p.A.		19766

# How to use RIS Data Yourself?

## Example: RIS-live

- <https://ris-live.ripe.net/>
- A websocket with BGP update messages in JSON format
- Most suitable for getting a *filtered stream* of BGP updates.

“Easy” to use from your own code.

Also used in open source projects and commercial projects.

### Demo

Subscriptions to the stream are sent as a JSON object containing various filter parameters. You can adjust the parameters below and see the messages that are streamed on the right.

```
{
  "prefix": null,
  "path": 3333,
  "type": null,
  "require": null,
  "moreSpecific": true,
  "lessSpecific": false,
  "host": null (all),
  "peer": null,
  "socketOptions": {
    "includeRaw": false,
    "acknowledge": true
  }
}
```

### Code examples

Below are simple examples of using the RIS Live WebSocket interface. For a full guide, see the [RIS Live manual](#).

JavaScript Python

```
/*
Subscribe to a RIS Live stream and output
every message to the javascript console.

The exact same code will work in Node.js
after running 'npm install ws' and including
the following line:

const WebSocket = require('ws');
*/
var ws = new WebSocket("wss://ris-
live.ripe.net/v1/ws/?client=js-example-1");
var params = {
  moreSpecific: true,
  host: "rrc21",

```

### Live RIS BGP messages

Connected 96 matching messages ~124 kbit/s

```

## You *are* probably using RIS data

- RIS is one of the key tools for capturing the development of the Internet
- You *are* probably using RIS data indirectly
- You *can* use this data yourself
  - This can be complicated - in depth bonus?
